Programmer Task 1

The exercise is to write a program which is adding name property into each leaf of given tree structure from `tree.json` file with name from `list.json` file. You should correlate structures through `category_id` from `list.json` and `Id` in `tree.json`.

The output should be similar to:

```
[

…

{"id":19", "name":"Zdrowie i uroda","children":[]},

...

]
```

Things to consider in your implementation

- Tree nesting level - in some cases nesting level could be really deep
- Testability

Deliverables:

- Code (github/gitlab repository)
- README.md file containing instructions so that we know how to build and run your code
